

PharmaWatch

Medicine costs, delivered to your PIN

Pharmacy prices and delivery charges make comparison tedious. Built for patients and caregivers.

Team PharmaWatch · Jatin Singh, Kush Pathak

Medicine or prescription + PIN

Compare delivered offers

Pharmacy order plan

WHY COMPARING IS HARD TODAY

1 Fees appear only at checkout

Each pharmacy has its own delivery fee, threshold and charges: Apollo ₹93.22 below ₹199 · Truemeds ₹109 + ₹11 below ₹200 · 1mg ₹50 below ₹500 · SastaSundar ₹29 below ₹149.

2 One medicine, hundreds of brands

Brands with the same salt, strength and form in our catalogue: Dolo 650, 500 · Stamlo 5, 281 · Atorbest 10, 655.

3 A prescription is a basket

Fees are charged per pharmacy order, so the cheapest place for each medicine alone can add up to a dearer total.

Why we built PharmaWatch

Type a medicine or a whole prescription and your PIN. PharmaWatch shows **what each pharmacy really costs delivered**, finds **cheaper brands with the same composition**, and plans **the cheapest way to order everything**.

Why we built it

- Buying medicines online should be simple, but the price on the shelf is rarely the price you pay.
- Each pharmacy adds its own delivery fee, free-delivery threshold and platform charge, and they appear only at checkout.
- The same tablet is sold under hundreds of brands, and a prescription is split across several orders.
- Comparing all of this by hand is slow, so people overpay on medicines they buy every month.

How it works

- You type a medicine or a whole prescription, and your PIN.
- A catalogue of 246,046 Indian medicines identifies the salt, strength and form, at no cost.
- SerpApi's Google Shopping search finds live listings from 10 pharmacies; extra same-salt searches widen the pool.
- Delivery rules for your PIN turn each listing into a delivered price, and an optimiser picks the cheapest set of orders.

Who it is for

- **Patients on long-term medicines** (blood pressure, diabetes, cholesterol, thyroid): compare the delivered price of a monthly refill and see cheaper brands with the same composition.
- **Caregivers** buying for family: enter a whole prescription once and get one or two orders that cost least in total.
- **AI assistants** (Claude and other MCP clients): call PharmaWatch's tools to answer "where is this cheapest, delivered to me?"

What it solves

- Shows what each pharmacy really costs delivered: Stamlo 5 at ₹40 on the shelf costs ₹133.22 delivered from Apollo.
- Finds brands with the same salt, strength and form for less: Amodep 5 at ₹2.94 per tablet.
- Plans the cheapest way to buy a whole prescription: ₹138.39 against ₹174.25 for the exact prescribed brands in our demo.
- Gives AI agents the same answers through MCP.

Swaps share salt, strength and form. Check with a doctor or pharmacist before switching. Price information, not medical advice.

The shelf price is not the price you pay

Stamlo 5 (amlodipine 5 mg), delivered to PIN 110001. Captured 9 Oct 2026.

CHEAPEST SHELF PRICE

₹40.00

Apollo Pharmacy
Stamlo-5, 15 tablets

WHAT IT COSTS DELIVERED

₹133.22

₹93.22 delivery below a ₹199 order
₹8.88 per tablet

CHEAPEST DELIVERED, SAME SALT

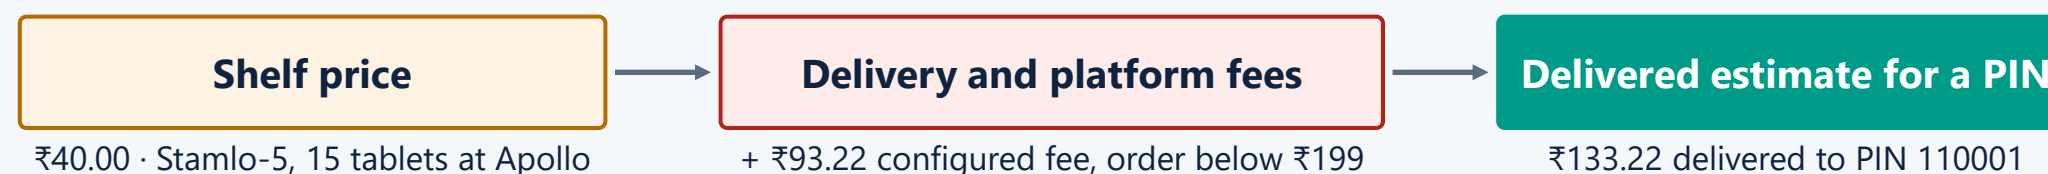

₹44.08

Amodep 5 at SastaSundar, 15 tablets
₹2.94 per tablet

3× The lowest shelf price cost three times more per tablet than the cheapest delivered option with the same composition.

Comparing shelf prices picks the wrong pharmacy. Comparing one brand misses cheaper brands with the same salt, strength and form.

A LOWER SHELF PRICE CAN BECOME A HIGHER DELIVERED ESTIMATE

The **delivery estimation engine** factors in your **PIN code**, **pharmacy fees** and **free-delivery thresholds** to reveal what a deal could actually cost.
SerpApi finds the pharmacy prices; our delivery engine adds the journey, factoring in PIN-based fees and free-delivery thresholds to **estimate the cost at your doorstep**.

Why it matters: ₹1.63 lakh crore was spent at pharmacies in 2022-23, 21.2% of India's current health expenditure, and households paid **43.4%** of total health expenditure out of their own pocket. Long-term prescriptions for blood pressure, diabetes or cholesterol are bought again every month, so a cheaper way to buy them saves money every month. *Source: National Health Accounts Estimates 2022-23, Ministry of Health and Family Welfare (as reported by Medical Dialogues).*

How the engine works behind the scenes

What runs between a search and an answer, and the decisions that keep SerpApi use low.

1 • From a name to a medicine, 0 credits

- Every query is looked up first in a SQLite catalogue of 246,046 Indian medicines and 17,028 compositions.
- A name without a strength ("paracetamol") returns the options instead of searching; the user picks one.
- Misspellings are corrected against the catalogue ("dollo 650" → Dolo 650). Gemini only chooses among candidates the catalogue supplies, and its pick is cached for 30 days.

2 • One main search, prices in about 3 seconds

- One SerpApi google_shopping call; json_restrictor returns only the listing fields we use.
- Listings are mapped to 10 pharmacies, and each title must match the brand and strength (look-alikes such as Stamlo Bis are rejected).
- Delivery and platform fees for the PIN are added, and the main list streams to the browser over SSE while the rest of the search continues.

3 • Few results? Widen the pool

- Google often returns few or none of the searched brand: "Pan 40 price" gave 24 listings and not one Pan 40.
- So up to three same-salt searches run in parallel (salt + "tablet generic", the same + a pharmacy's name, a discounted-generic brand), plus a "brand + tablet" retry when the brand is missing.
- Every listing of every search is matched against every brand of the composition (281 for Stamlo 5), so the searched medicine is also priced from the alternatives' results.
- Thin results (fewer than 3 real listings) are cached for 1 hour, not 24, so they refresh sooner.

4 • Keeping SerpApi cost low

- A repeat within 24 h is an exact Redis hit: 0 credits, 7.6 ms on average against 12.9 s for a SerpApi call (measured 9 Oct 2026, 8 hits and 17 calls).
- Similar wording can reuse a cached search (MiniLM cosine ≥ 0.88), but only with the same parameters and the same numbers.
- Product pages are looked up front only for the cheapest offer and the cheapest alternative (8 → 2 per new medicine); any other page costs 1 credit when clicked, then is cached 24 h.

5 • What one medicine costs

- New medicine on the website: typically 4 credits (3 for a combination), +1 for the brand retry, up to 8 with product pages.
 - In a prescription or through MCP: the same searches, with a product page only for the offer the user picks.
 - Repeat within 24 h: 0.
- A name without a strength: 0.
- Guards: a daily budget (30 credits on the hosted API), at most 3 searches at once, and an optional second key used only after the first runs out.

6 • Other decisions that pay off

- Everything after the catalogue lookup runs in parallel: in the Telma 40 run, 9 calls took 33.8 s one after another, but main results arrived at 2.6 s and alternatives at 5.2 s.
- The basket is optimised with branch-and-bound: exact over the cheapest offer per pharmacy and medicine, and checked against brute force on 200 random baskets.
- The website, the API and the MCP tools call the same Python functions, so they share one cache, one credit budget and the same answers.

PART 2

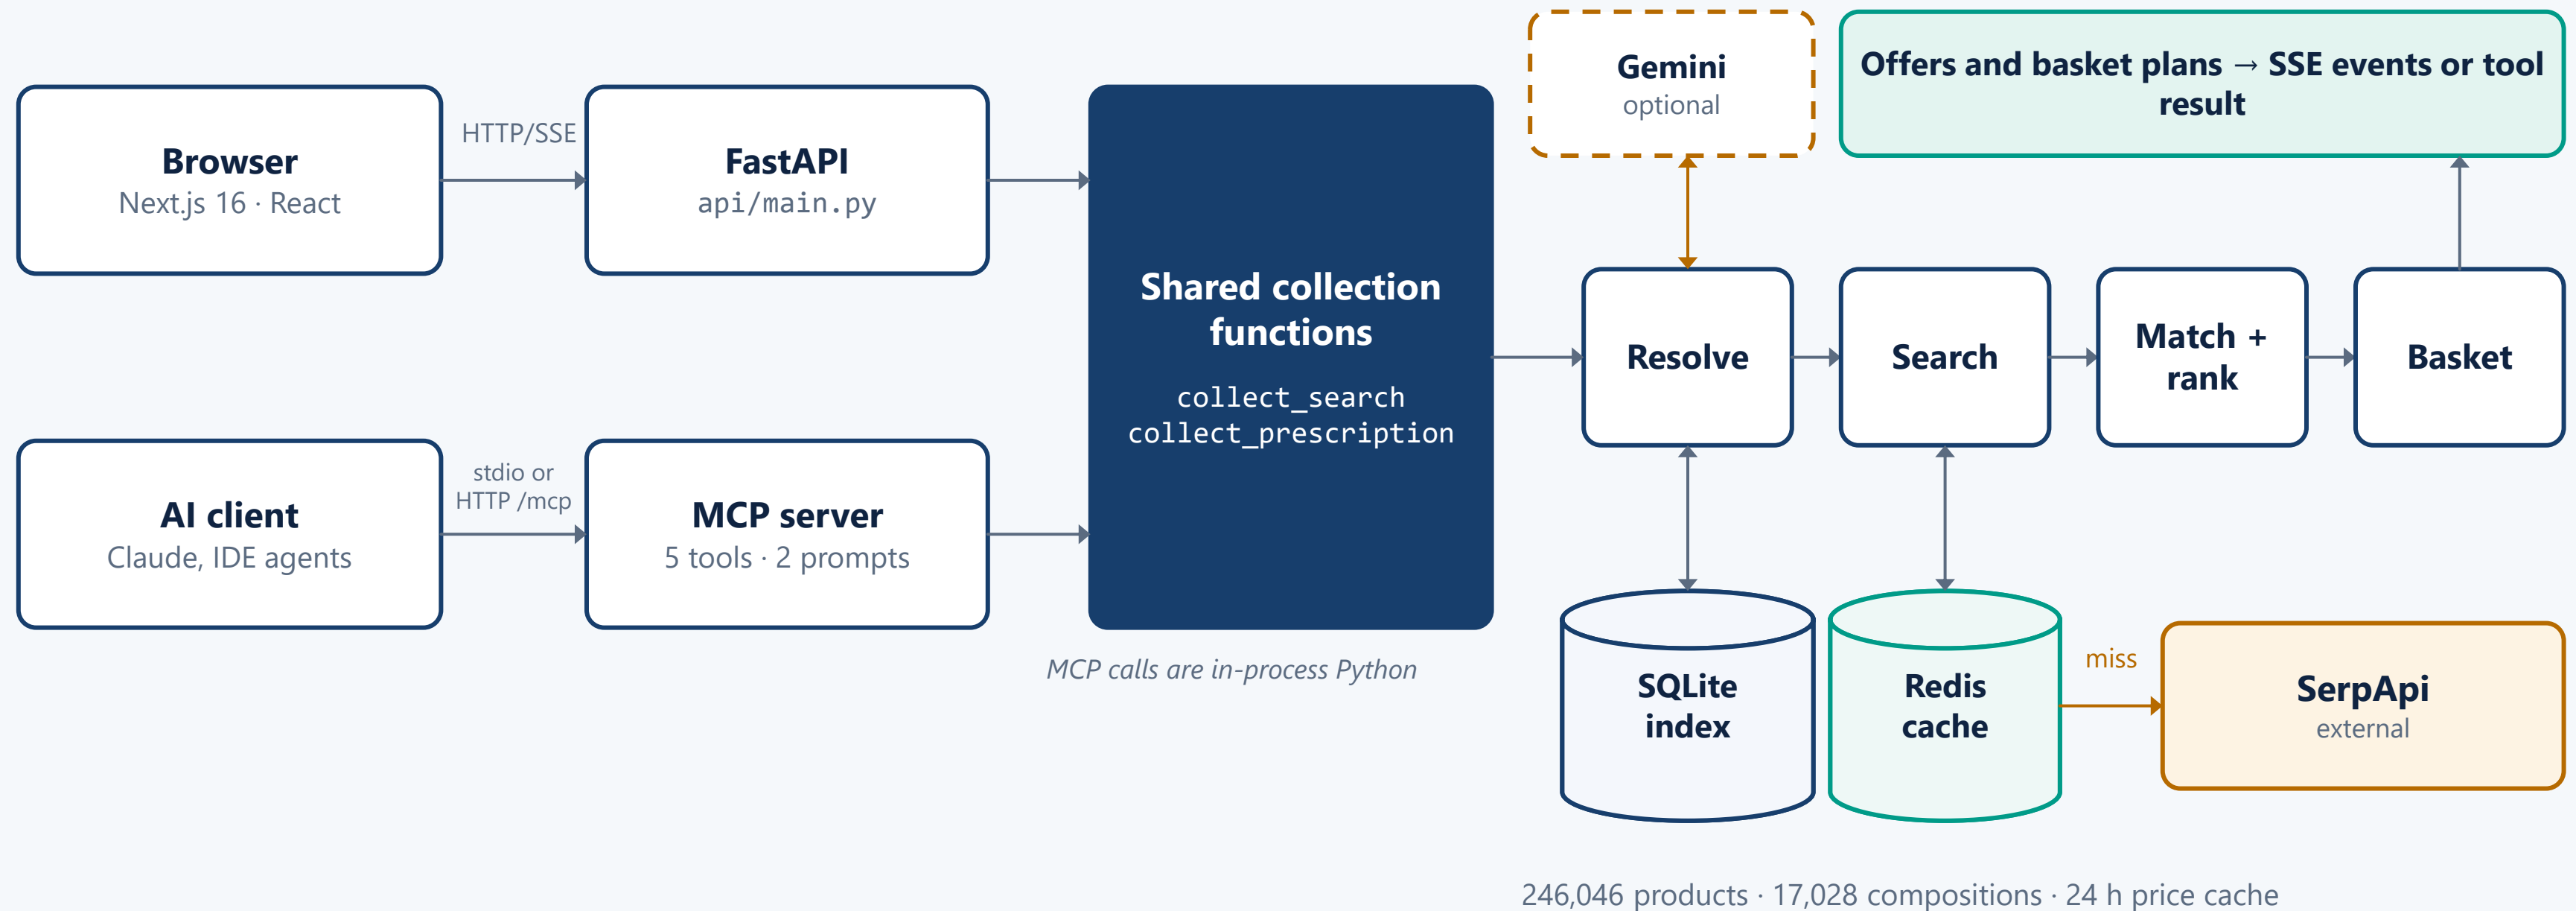

The engineering

How search listings become delivered prices and purchase plans.

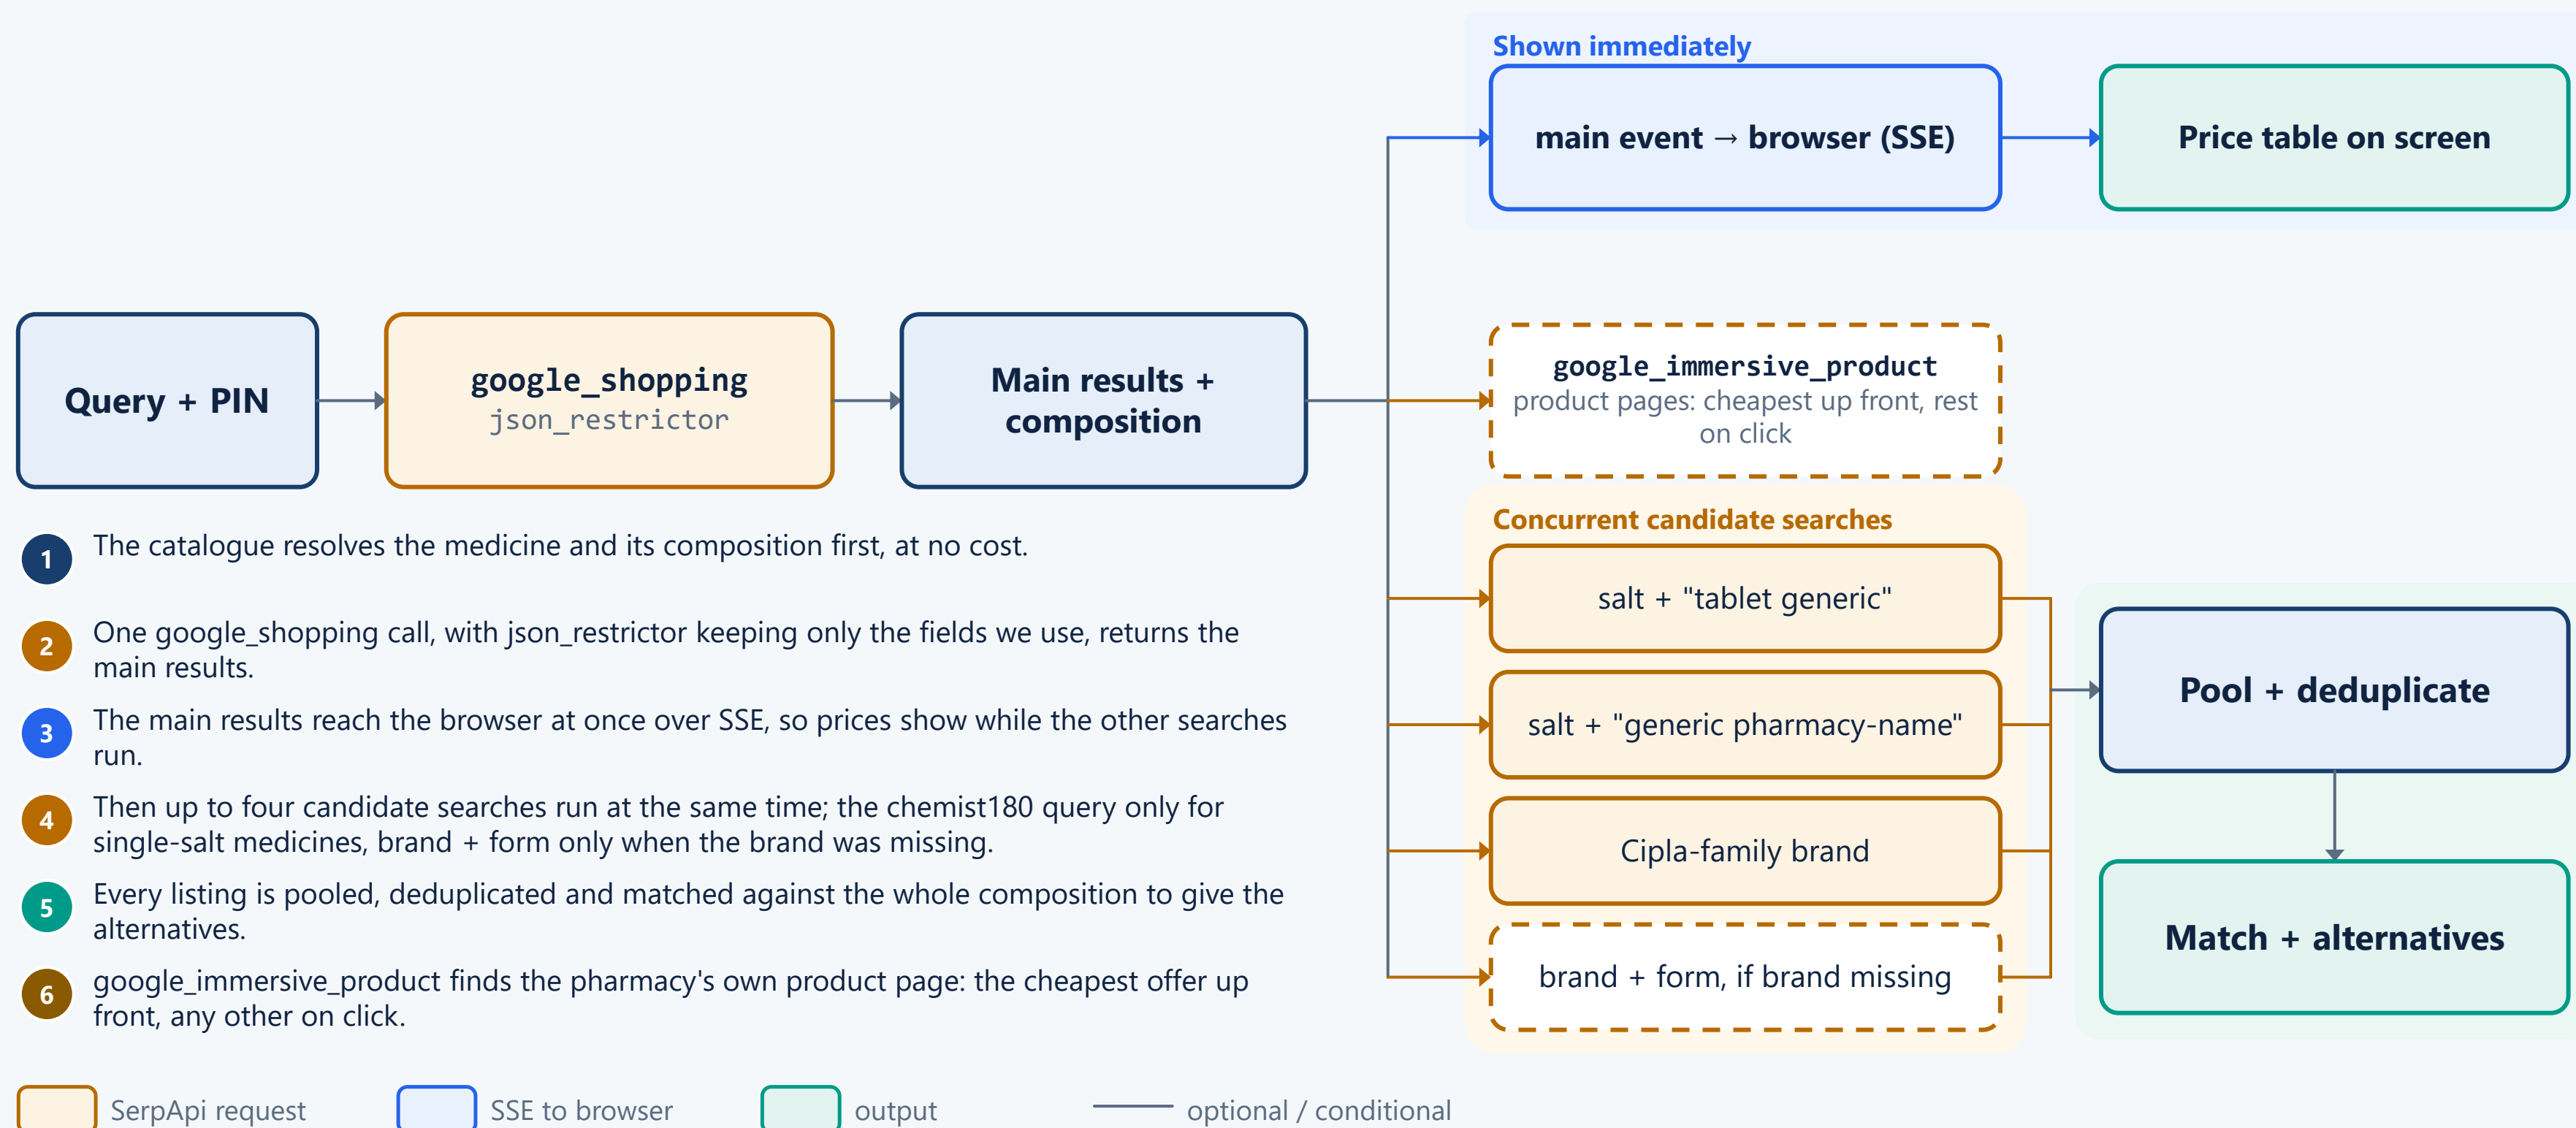

One backend, browser and agent access

A browser and an AI client call the same Python functions and pipeline.

SerpApi searches expand the offer pool

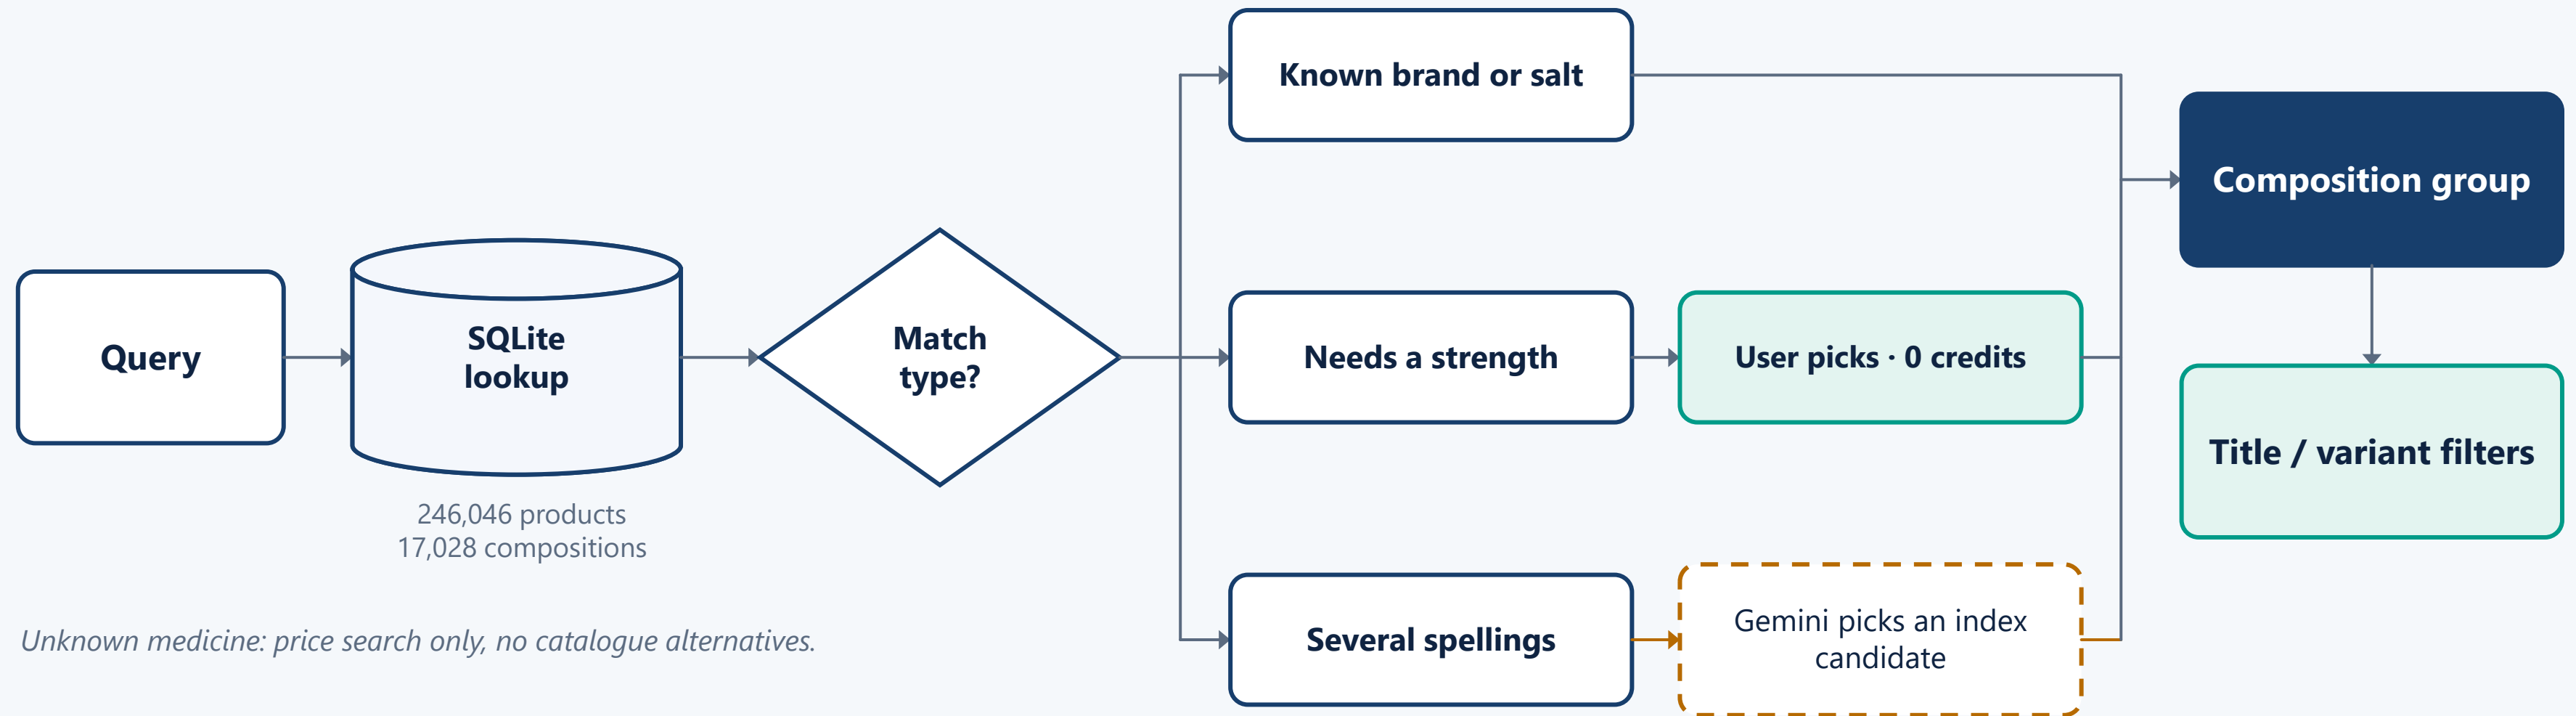

google_shopping finds listings. json_restrictor trims fields. google_immersive_product finds product pages.

- 1 The catalogue resolves the medicine and its composition first, at no cost.
- 2 One google_shopping call, with json_restrictor keeping only the fields we use, returns the main results.
- 3 The main results reach the browser at once over SSE, so prices show while the other searches run.
- 4 Then up to four candidate searches run at the same time; the chemist180 query only for single-salt medicines, brand + form only when the brand was missing.
- 5 Every listing is pooled, deduplicated and matched against the whole composition to give the alternatives.
- 6 google_immersive_product finds the pharmacy's own product page: the cheapest offer up front, any other on click.

Catalogue-grounded medicine matching

Identity comes from a SQLite catalogue. Gemini only picks among candidates the index supplies.

COMPOSITION KEY

salt(s) + strength(s) + form + release

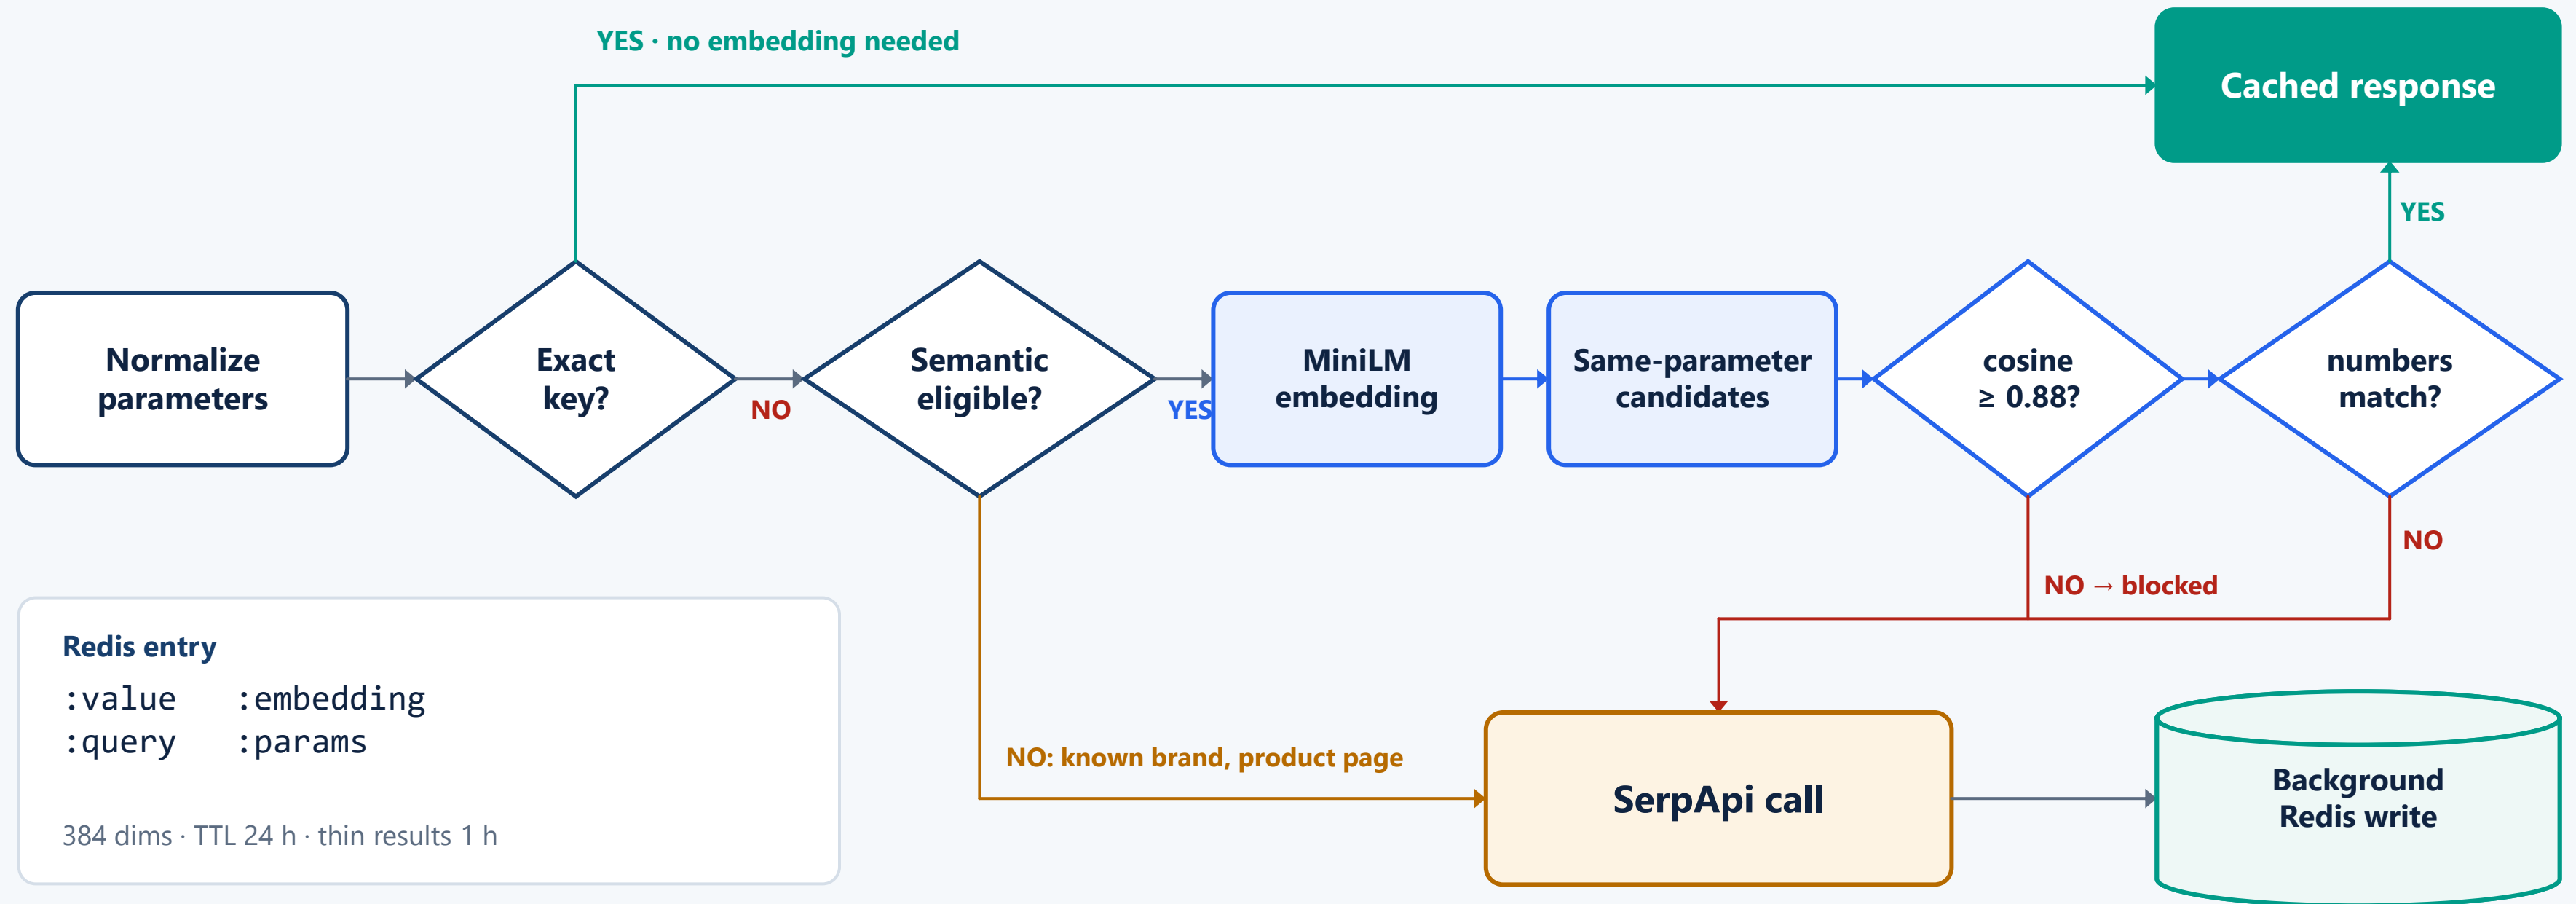

Stamlo 5 → amlodipine:5mg|tablet| (no release modifier)

Stamlo 5 listing ✓ kept

Stamlo Bis 5 listing ✗ rejected: different product

Cache reuse with explicit constraints

Exact keys first. Semantic reuse only where it is safe, then parameter and numeric checks.

Dolo 500 vs Dolo 650: cosine 0.949, numbers differ → SerpApi, not a cached Dolo 500

Search listings become delivered estimates

What a listing says, what our delivery rules add, and the price you pay.

$$\text{Delivered estimate} = \text{item subtotal} + \text{delivery fee} + \text{platform fee}$$

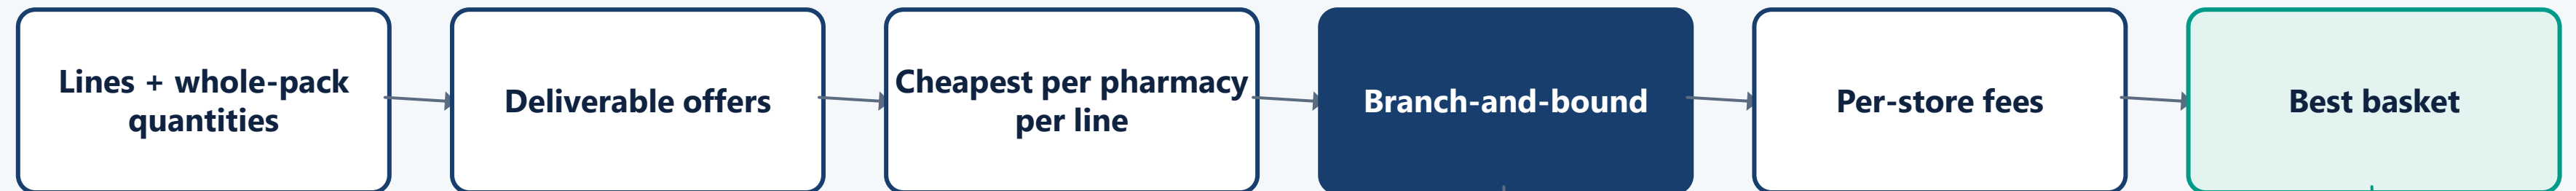

Field	Comes from	Apollo · Stamlo-5 15's · PIN 110001
Pharmacy	Search: seller name	Apollo Pharmacy
Product and pack	Search: title, checked against the catalogue	Stamlo 5, 15 tablets
Item price	Search: listing price	₹40.00
PIN zone	Rules: PIN prefix	110001 → metro
Delivery fee	Rules: pharmacy, zone and order subtotal	₹93.22 (₹79 + GST, order below ₹199)
Platform fee	Rules: pharmacy and order subtotal	₹0 below ₹199
Delivered estimate	Sum of the above	₹133.22

WHAT THE PIPELINE DOES

- 1 SerpApi's Google Shopping search returns the seller and the listing price.
- 2 The seller is matched to one of 10 pharmacies; the title is checked against the medicine, and duplicates are dropped.
- 3 Your PIN maps to a delivery zone: metro, tier 2, tier 3, remote or unserviceable.
- 4 That pharmacy's rules add its delivery fee, free-delivery threshold and platform fee on the order subtotal.
- 5 Fees come from checkout carts or the pharmacy's Google product page. Medplus publishes none, so it is shown but never picked as cheapest.

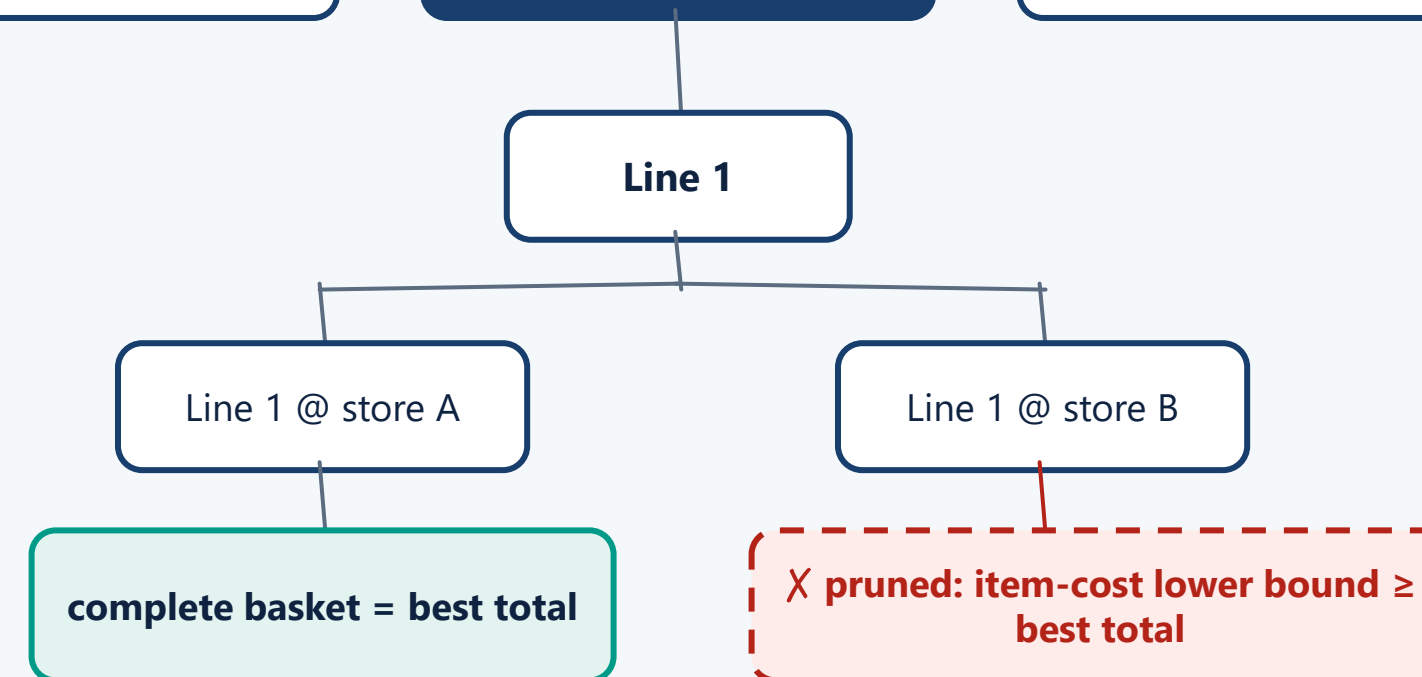

Whole-prescription optimisation

Fees apply to each pharmacy's subtotal, so the cheapest items can still lose.

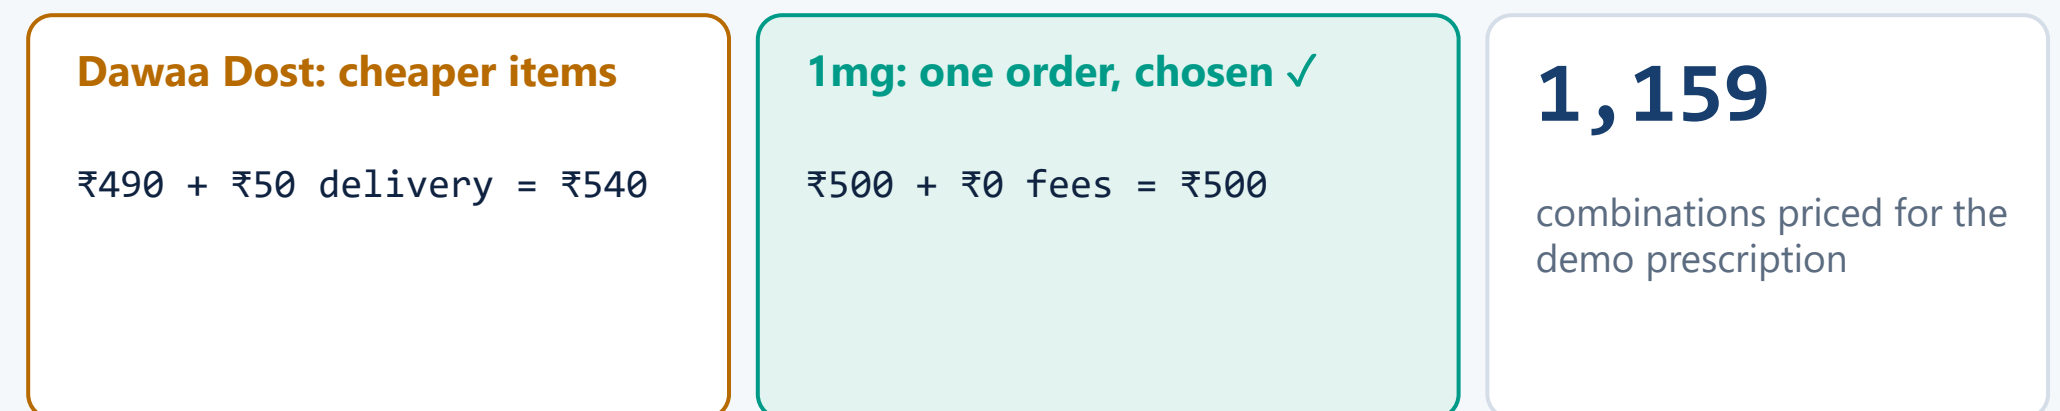

How the basket is chosen

- 1 Each medicine becomes whole packs.
- 2 Each pharmacy keeps its cheapest offer per medicine.
- 3 Branch-and-bound cuts a branch once its item cost alone reaches the best total.
- 4 Fees are added on each pharmacy's subtotal.
- 5 Three plans come out.

TEST FIXTURE · synthetic offers, configured delivery rules

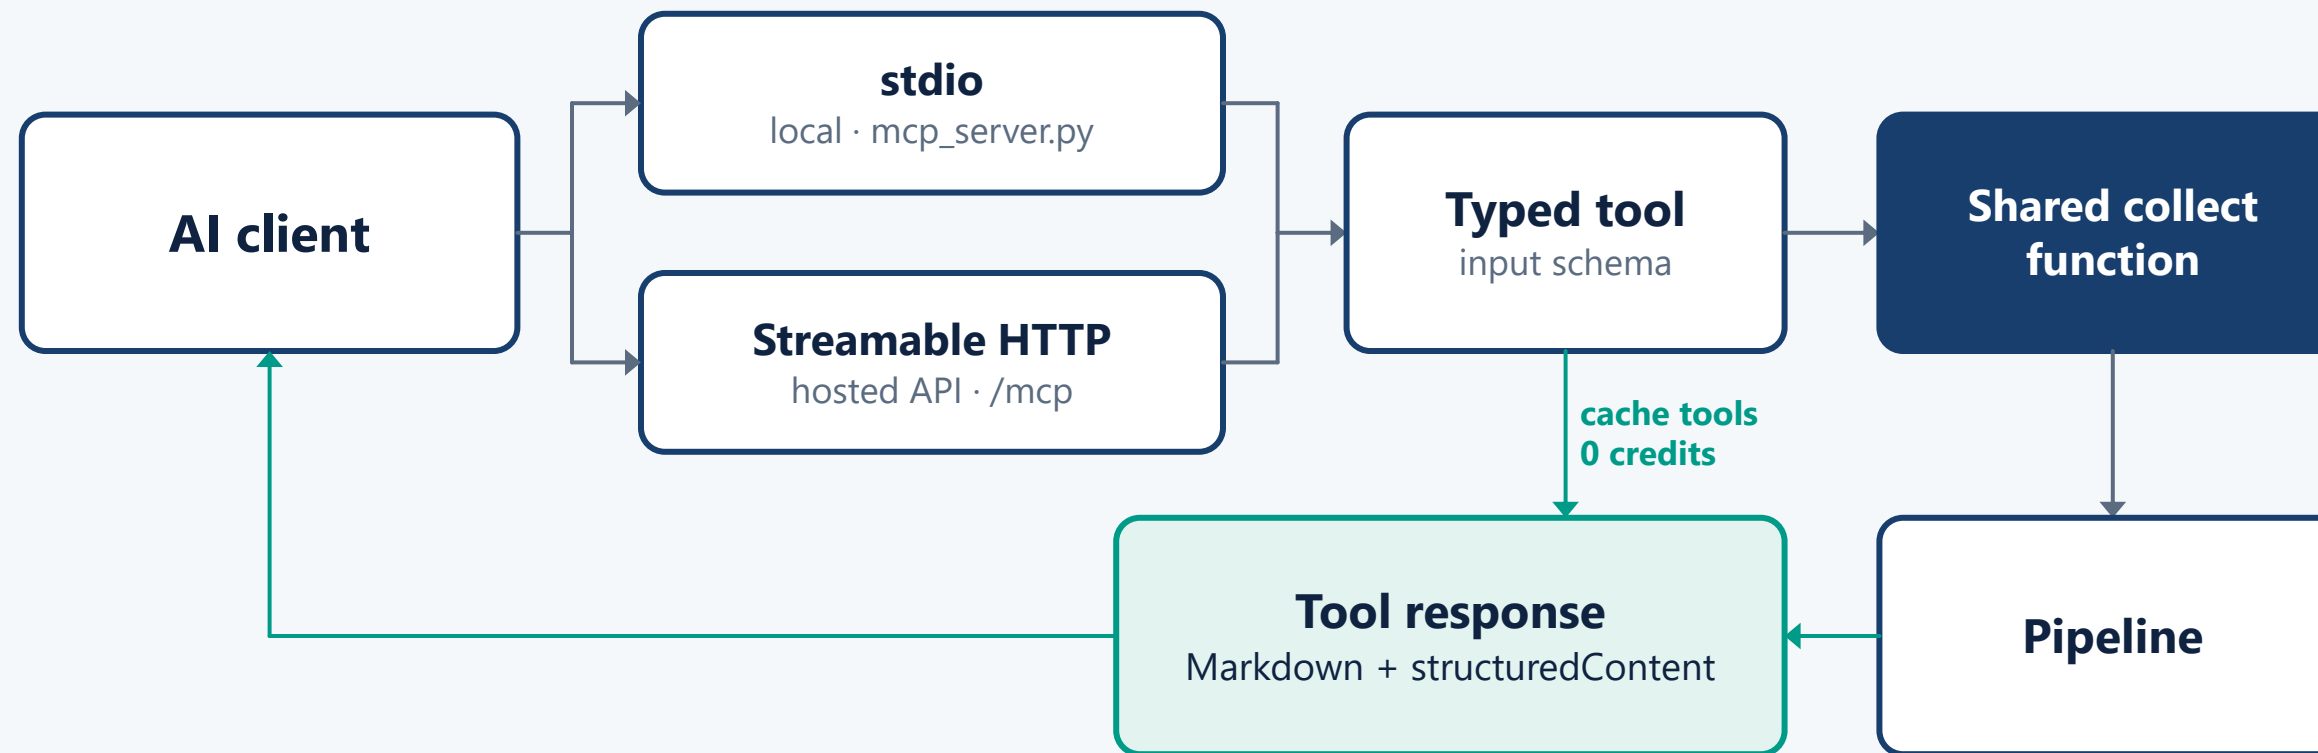

Up to 8 medicines per prescription · node cap 2,000,000

MCP tools make the workflow agent-accessible

Typed tools over stdio or Streamable HTTP, answering in Markdown plus structured content.

CORE FEATURE

Why MCP: an assistant cannot see delivery fees or same-salt brands from a web search. MCP gives any client (Claude, Cursor, IDE agents) the same engine, cache and credit budget as the website, so an agent gets the answers a shopper gets.

5 TOOLS · 2 PROMPTS

search_medicine

delivered offers + same-salt swaps · 3–5 credits new, 0 cached

plan_prescription

up to 8 lines, three basket plans

get_buy_link

11 lookups · 11 from cache
0 credits

Deployment and controlled resource use

A static site, one Docker API and a private Redis on Render's free plan, with request and credit limits.

EVERY SEARCH REQUEST

Blueprint config: 30 credits/day · 3 concurrent searches. Keep-awake: GitHub Actions calls /api/health every 10 min

Data we can stand behind

Every fee has a source, every swap has a reason, and nothing is guessed.

Where the data comes from

Medicine catalogue

Indian Medicine Dataset (JuniorAlive, MIT licence), 253,973 rows, rebuilt into 246,046 products, 17,028 compositions and 7,641 manufacturers by `scripts/build_medicine_index.py`.

Prices

Live Google Shopping results through SerpApi at search time, cached for at most 24 hours. No price is typed in by hand.

Delivery fees

One rules file, `notes/postal_codes_delivery_rules.json`. Every pharmacy entry names its source and date.

Checks

44 rules-integrity checks (every pharmacy recognised and priced), 37 delivery-fee checks and 126 matching checks pass (9 Oct 2026).

Delivery fees

Checkout carts

Apollo (PIN 110001), PharmEasy (250002), 1mg (Gurugram), Truemeds (110044): fees read from real carts, Oct 2026.

Google product-page shipping

Netmeds, SastaSundar, Chemist180, Dawaa Dost (SerpApi `google_immersive_product`, 3 Oct 2026; Gurugram and Guwahati identical) and Medizinhub (9 Oct 2026).

No published fee

Medplus: shown, never picked as cheapest.

Removed, fees unverifiable

Kogland, Medivik, Magicine, eMedicalwala: removed rather than priced on a guess.

Safe by design

Swaps need an identical composition key

Salt, strength, form and release must all match; listing titles are checked against it, so look-alikes are rejected.

Every swap carries a warning

Ask a doctor or pharmacist before switching. Not medical advice.

Estimates are labelled

Estimated pack sizes are marked ~; unknown fees stay visible in red.

Keys and credits are protected

Keys never in code or images; daily budget and concurrency limits.

Problems we hit, and how we fixed them

Six of the eight documented in the README, and why each fix is necessary.

A semantic cache confused strengths

Problem "Dolo 500" and "Dolo 650" score 0.949 cosine.

Fix A numeric guard; brand searches are looked up by exact name only.

Why a wrong cache hit shows another medicine's prices.

Titles often omit pack size

Problem "Stamlo 5MG Tablet ₹66.02": 15 or 30 tablets?

Fix Estimate from the brand's other listings, then the catalogue; mark it ~.

Why without a per-tablet price, the cheapest offer was skipped.

Google returns look-alike medicines

Problem A Stamlo 5 search: 22 listings, only 8 Stamlo 5 (others: Esta 5, Stamlo Bis).

Fix Titles must match brand and strength; variants and second doses are rejected.

Why comparing a different drug is wrong and unsafe.

Cheapest generics are cheap only after discount

Problem Pharmacies' suggestions ranked 449th of 500 by list price.

Fix Extra searches for reach ("tablet generic", a pharmacy name, a discounted brand), pooled.

Why otherwise we lose to the pharmacy's own suggestion.

A brand search often misses the brand

Problem "Pan 40 price": 24 listings, none of Pan 40.

Fix Pool every search against the whole composition; retry with "Pan 40 tablet".

Why a 5-medicine basket went from 3 compared medicines to 5.

Step by step was slow

Problem 9 SerpApi calls in a row took 33.8 s.

Fix Run in parallel and stream: main results at 2.6 s, alternatives at 5.2 s.

Why shoppers see prices in seconds.

PART 3

What comes next

Making the data stronger, with doctors and pharmacists.

Where we take it next

From a working hackathon build to a service patients and doctors can rely on.

Built and tested

- Delivered price for 10 pharmacies, 9 with verified fees
- Same-composition swaps from 246,046 products
- Three basket plans for a prescription
- 5 MCP tools, hosted and local
- Every SerpApi call visible and cached

TEST RESULTS AND MEASURED PERFORMANCE · 9 OCT 2026

200 / 200 random baskets: branch-and-bound total = brute-force total, 0 mismatches

Automated checks, all passing: 62 API · 92 MCP · 126 matching + pipeline · 25 basket · 37 delivery fees · 44 rules integrity

Pan 40, first run: 19.2 s · 4 credits Repeat: 111 ms · 0 credits

Prescription from MCP, cached: 11 lookups · 0 credits

Basket search: 1,159 combinations

Next

- **Catalogue reviewed with doctors and pharmacists:** clinicians confirm which brands are interchangeable.
- **Regular data refresh, full multi-salt compositions:** new brands recognised; today's dataset stores at most two salts.
- **Verified delivery fees for every pharmacy,** and more pharmacies.
- **Publish the connector to the MCP Registry:** server.json is ready.

Later

- **Prescription photo to basket** (OCR).
- **Price alerts** for monthly refills.
- **Clinician-reviewed lists** of interchangeable brands.

The catalogue decides what counts as an alternative, so every improvement to it makes every search stronger.
